Sample Questions and Answers from the 2014 AP Statistics Multiple Choice Section

While the full set of answers is extensive, here are representative examples that illustrate typical questions, solutions, and strategies.

Question 1: Descriptive Statistics

Q: The median of a data set is 50, and the data set contains 20 values. Which of the following could be the sum of all values in the data set?

1. 1000
2. 950
3. 1050
4. 1100

A: Since the median is 50, the 10th and 11th values (when ordered) are both 50 or close. The minimum total sum occurs when the lower 10 values are just below 50 and the upper 10 just above 50, but the median indicates the middle value(s). Assuming a symmetric distribution around 50, the sum would be approximately: - $20 \times 50 = 1000$ Correct answer: 1000 Strategy: Recognize the median's position and approximate the sum accordingly.

Question 2: Probability

Q: A fair six-sided die is rolled twice. What is the probability that the sum of the two rolls is 7?

1. $1/6$
2. $1/8$
3. $1/12$
4. $1/36$

A: Possible pairs that sum to 7 are: - (1,6), (2,5), (3,4), (4,3), (5,2), (6,1) Total favorable outcomes: 6 Total possible outcomes: $6 \times 6 = 36$ Probability = $6/36 = 1/6$ Correct answer: $1/6$ Strategy: List out all favorable pairs to ensure accuracy.

Question 3: Data Interpretation

Q: A scatterplot shows a strong positive correlation between hours studied and test scores. Which of the following statements is most appropriate?

1. The correlation coefficient is close to 0.
2. Studying more causes higher test scores.
3. There is an association, but causality cannot be inferred.
4. Test scores are independent of hours studied.

A: The correct answer is: Most appropriate statement: There is an association, but causality cannot be inferred. Strategy: Remember that correlation does not imply causation.
