Problem: A 50.0 mL sample of nitrogen gas (N_2) at 25°C and 1.00 atm is compressed to 25.0 mL at the same temperature. Assuming ideal gas behavior, calculate the final pressure of the nitrogen gas after compression.

Solution Steps: 1. Write down known variables: - Initial volume, $V_1 = 50.0\text{ mL}$ - Final volume, $V_2 = 25.0\text{ mL}$ - Initial pressure, $P_1 = 1.00\text{ atm}$ - Temperature remains constant, $T = 25^\circ\text{C}$ (convert to Kelvin: $25 + 273.15 = 298.15\text{ K}$) 2. Use Boyle's Law ($P_1V_1 = P_2V_2$): $P_2 = (P_1V_1) / V_2$ 3. Substitute known values: $P_2 = (1.00\text{ atm} \times 50.0\text{ mL}) / 25.0\text{ mL} = 2.00\text{ atm}$ Answer: The final pressure after compression is 2.00 atm.

The questions range from analyzing chemical reactions to calculating thermodynamic properties, placing emphasis on both conceptual understanding and mathematical proficiency. For educators and students alike, reviewing this set of questions offers valuable insight into the depth and scope of knowledge expected at the AP level.

Overview of the 1996 Questions

The 1996 AP Chemistry FRQ includes three main questions:

1. Acid-Base Titration and pH Calculations

2. Thermodynamics and Enthalpy Changes
3. Atomic Structure and Electron Configuration

Each question probes different facets of chemistry, requiring varied problem-solving approaches, from qualitative reasoning to quantitative calculations.

Question 1: Acid-Base Titration and pH Calculations

Context and Core Concepts

This question centers around an acid-base titration involving a strong acid and a strong base. Students are asked to analyze the titration curve, calculate the pH at various points, and interpret the results.

Key Components

1. Titration Curve Analysis:

Students examine the pH vs. volume of titrant added, identifying the equivalence point where the acid and base neutralize each other.

1. Calculations of pH:

Tasks include calculating the initial pH of the solution, the pH at various stages of titration, and the pH at the equivalence point.

1. Understanding of Acid-Base Equilibria:

Recognizing that for strong acid-strong base titrations, the pH at equivalence is typically neutral (~ 7) but can vary with concentration.

Approach and Strategies

1. Use the initial concentration to determine the initial pH via the negative logarithm of the hydrogen ion concentration.
1. During titration, apply stoichiometry to find the remaining moles of acid or base.
1. At the equivalence point, consider the neutrality or potential for slight deviations due to water auto-ionization.
1. Use the Henderson-Hasselbalch equation judiciously only when dealing with weak acids/bases; for strong acid-base titrations, direct calculations are often more straightforward.

Significance

Understanding titration curves is fundamental in analytical chemistry. This question tests students' ability to connect graphical data with chemical principles and perform accurate calculations that reflect real lab scenarios.

Question 2: Thermodynamics and Enthalpy Changes

1. Convert heat quantities into molar enthalpy changes by dividing by the number of moles involved.
1. When applying Hess's Law, carefully manipulate the equations, ensuring proper cancellation of intermediate species.
1. Cross-verify calculations with standard enthalpy data to assess the accuracy of experimental results.

Significance

This question emphasizes the importance of thermodynamic principles in understanding energy changes during chemical reactions. It also illustrates the practical aspects of calorimetry and the utility of Hess's Law in real-world scenarios.

Question 3: Atomic Structure and Electron Configuration

Context and Core Concepts

The third question explores atomic structure, focusing on electron configurations, quantum numbers, and periodic trends. It often involves predicting properties based on electronic arrangements.

Key Components

1. Electron Configuration Determination:

Given an element or ion, students write the full or abbreviated electron configuration.

1. Quantum Numbers:

Assigning principal (n), azimuthal (l), magnetic (m_l), and spin (m_s) quantum numbers to specific electrons.

1. Periodic Trends:

Analyzing how atomic size, ionization energy, or electronegativity varies across periods and groups.
