To illustrate the depth and diversity of olympiad problems, here are a few sample problems along with brief solution outlines.

Example 1: Number Theory

Problem: Find all two-digit numbers such that the number is equal to the sum of the squares of its digits. Solution Outline: - Let the number be $10a + b$, where a and b are digits. - The condition: $10a + b = a^2 + b^2$. - Since a is from 1 to 9, b from 0 to 9. - Test possible values: for each a , solve $10a + b = a^2 + b^2$. - For example, $a=3$: $30 + b = 9 + b^2 \rightarrow b^2 - b - 21 = 0$. - Solve quadratic: discriminant $\Delta = 1 + 84 = 85$, not a perfect square $\rightarrow$ no integer solutions. - Repeat for other a , find solutions only for $a=1$ and $a=5$. - Final solutions: 13 and 55.

Example 2: Geometry

Problem: In a triangle ABC , point D lies on side BC . If AD is the median, and AD equals BD , find the measure of angle BAC . Solution Outline: - Use coordinate geometry or geometric properties to analyze the problem. - Recognize that the median AD and segment BD are equal, implying specific ratios. - Apply the properties of medians and segments in triangles. - Derive that the triangle is isosceles with $AB=AC$, leading to particular angle measures.
