Sample Free EMT Test Questions and Answers

Below is a curated list of sample questions, covering key topics you're likely to encounter on the exam. Each question includes a detailed explanation to enhance understanding.

Question 1: Airway Management

Q: A 65-year-old male patient is found unresponsive. You note snoring respirations. What is the most appropriate initial action?

- a) Perform a jaw-thrust maneuver
- b) Insert an oropharyngeal airway
- c) Suction the airway
- d) Begin rescue breathing with mouth-to-mask

A: b) Insert an oropharyngeal airway

Explanation: Snoring respirations suggest airway obstruction, often from the tongue. The initial step is to open the airway using a head-tilt/chin-lift or jaw-thrust maneuver (depending on suspected trauma). If airway patency is compromised, inserting an oropharyngeal airway helps maintain airway patency. Rescue breathing is appropriate if the patient is not breathing, but in this case, airway management takes priority.

Question 2: Cardiac Emergencies

Q: What is the most common symptom of a myocardial infarction (heart attack)?

- a) Sudden weakness

- b) Chest pain or discomfort
- c) Shortness of breath only
- d) Abdominal pain

A: b) Chest pain or discomfort

Explanation: The hallmark symptom of a myocardial infarction is chest pain or discomfort, often described as a pressure, squeezing, or heavy sensation. It may radiate to the arm, neck, jaw, or back. While weakness, shortness of breath, and abdominal pain can occur, chest pain is the most classic and common symptom.

Question 3: Trauma Assessment

Q: When assessing a trauma patient, which step is performed first during the primary assessment?

- a) Check for responsiveness
- b) Control major bleeding
- c) Assess airway, breathing, and circulation (ABCs)
- d) Obtain a detailed history

A: c) Assess airway, breathing, and circulation (ABCs)

Explanation: The primary assessment focuses on identifying and treating life-threatening conditions. The ABCs are evaluated first to ensure the patient's vital functions are maintained. Responsiveness is assessed early, but the ABCs guide immediate interventions.

Question 4: Medical Emergencies

Q: A patient presents with sudden weakness on one side of the body, slurred speech, and drooping facial muscles. What is the most likely diagnosis?

- a) Seizure
- b) Stroke
- c) Hypoglycemia

d) Migraine

A: b) Stroke

Explanation: Sudden unilateral weakness, facial droop, and slurred speech are classic signs of a stroke, caused by cerebral ischemia or hemorrhage. Immediate transport and activation of stroke protocols are critical.

Question 5: Obstetric and Gynecological Emergencies

Q: During delivery, the umbilical cord is wrapped around the baby's neck. What should the EMT do?

a) Cut the cord immediately

b) Attempt to slip the cord over the baby's head if possible

c) Push the baby back into the mother's pelvis

d) Wait for the paramedics to arrive

A: b) Attempt to slip the cord over the baby's head if possible

Explanation: If the cord is around the baby's neck, try to gently slip it over the baby's head. If impossible, clamp the cord in two places and cut between clamps, but only if necessary. Do not delay delivery or attempt to pull the cord tightly.
