The Otto cycle is characteristic of gasoline engines, featuring a four-stroke process:

1. Intake Stroke: Air-fuel mixture enters the combustion chamber.
2. Compression Stroke: The mixture is compressed adiabatically, increasing pressure and temperature.
3. Power Stroke: Spark ignition causes combustion, rapidly expanding gases push the piston downward.
4. Exhaust Stroke: Combustion gases are expelled.

This cycle's efficiency depends on compression ratio, fuel properties, and combustion quality. Thermodynamics helps optimize these parameters to maximize power while minimizing fuel consumption.

1. Diesel Cycle (Compression Ignition Engines)

The Diesel cycle involves:

1. Intake Stroke: Only air enters the chamber.
2. Compression Stroke: Air is compressed adiabatically to a high pressure and temperature.
