Sample Soil Mechanics Exam Questions and Solutions Below, we present several typical exam questions with detailed solutions to illustrate the problem-solving process.

Question 1: Calculate the Effective Stress at a Depth of 10 m

Problem: Given a saturated clay soil with a unit weight of 18 kN/m^3 , determine the effective stress at a depth of 10 meters.

Solution: The effective stress (σ') at a certain depth is calculated using the total stress (σ) minus the pore water pressure (u).

1. Calculate total stress (σ): $\sigma = \gamma_{\text{soil}} \times z = 18 \text{ kN/m}^3 \times 10 \text{ m} = 180 \text{ kN/m}^2$
2. Calculate pore water pressure (u): Assuming the water table is at ground level (0 m), the water pressure at 10 m depth is: $u = \gamma_{\text{water}} \times z = 9.81 \text{ kN/m}^3 \times 10 \text{ m} = 98.1 \text{ kN/m}^2$
3. Calculate effective stress (σ'): $\sigma' = \sigma - u = 180 - 98.1 = 81.9 \text{ kN/m}^2$

Answer: The effective stress at 10 meters depth is approximately 81.9 kN/m^2 .

Question 2: Determine the Ultimate Bearing Capacity of a Square Footing

Problem: A square footing of size $2 \text{ m} \times 2 \text{ m}$ is to be constructed on a sandy soil with the following parameters: - Cohesion, ($c = 0$) - Friction angle, ($\phi = 30^\circ$) - Unit weight of soil, ($\gamma = 20 \text{ kN/m}^3$) Calculate the ultimate bearing capacity using Terzaghi's bearing capacity equation. Assume a depth of foundation ($D_f = 2 \text{ m}$) and an effective width ($B = 2 \text{ m}$).

Solution: The ultimate bearing capacity (q_u) is given by: $q_u = c N_c + \gamma D_f N_q + 0.5 \gamma B N_{\gamma}$ Where the bearing capacity factors for ϕ

$= 30^\circ$): $N_c = 30.14$, $N_q = 17.67$, $N_\gamma = 20.41$ } Since $(c=0)$: $q_u = \gamma D_f N_q + 0.5 \gamma B N_\gamma$ } Calculations: $\gamma D_f N_q = 20 \times 2 \times 17.67 = 706.8$, kPa } $0.5 \gamma B N_\gamma = 0.5 \times 20 \times 2 \times 20.41 = 408.2$, kPa } Total ultimate bearing capacity: $q_u = 706.8 + 408.2 = 1115$, kPa } Answer: The ultimate bearing capacity is approximately 1115 kPa.

Question 3: Assess the Slope Stability Using the Factor of Safety Problem: A 30° slope made of sandy soil is 10 meters high. The soil has a cohesion of 0 kPa and an internal friction angle of 30° . The soil unit weight is 20 kN/m^3 . Determine the factor of safety against slope failure using the infinite slope model.

Solution: The factor of safety (FoS) for an infinite slope is: $\text{FoS} = \frac{c' + (\sigma' \tan \phi)'}{\gamma H \sin \theta \cos \theta}$ } Since $(c' = 0)$: $\text{FoS} = \frac{\sigma' \tan \phi}{\gamma H \sin \theta \cos \theta}$ } Where: - $(\sigma' =)$ effective normal stress at the slope surface = $(\gamma H / 2)$ (assuming average stress), - $(H = 10, \text{m})$, - $(\phi = 30^\circ)$, - $(\gamma = 20, \text{kN/m}^3)$, - $(\theta = 30^\circ)$.

Calculations: $\sigma' = \frac{20 \times 10}{2} = 100$, kPa } $\tan \phi = \tan 30^\circ = 0.577$ } $\sin 30^\circ = 0.5$, $\cos 30^\circ = 0.866$ } $\text{FoS} = \frac{100 \times 0.577}{20 \times 10 \times 0.5 \times 0.866} = \frac{57.7}{86.6} \approx 0.666$ } Since the FoS is less than 1, the slope is unstable.

Answer: The factor of safety is approximately 0.67, indicating the slope is unstable under current conditions.

1. Shear Strength of Soils

Sample Question: Calculate the shear strength of a cohesionless soil with a friction angle of 30° and a normal stress of 100 kPa. Solution Overview: The solution applies the Mohr-Coulomb failure criterion: $\tau_{\max} = \sigma \tan \phi$ Step-by-step Breakdown: - Given Data: $(\phi = 30^\circ)$, $(\sigma = 100, \text{kPa})$ - Calculation: $(\tau_{\max} = 100 \times \tan 30^\circ \approx 100 \times 0.577 = 57.7, \text{kPa})$ - Interpretation: The maximum shear stress the soil can sustain without failure under 100 kPa normal stress is approximately 57.7 kPa. Key Takeaway: This problem demonstrates the application of the Mohr-Coulomb criterion for cohesionless soils, emphasizing the importance of friction angle in shear strength.

2. Consolidation and Settlement

Sample Question: Estimate the primary consolidation settlement of a clay layer 5 m thick with a coefficient of consolidation $(C_v = 1 \times 10^{-7}) \text{ m}^2/\text{sec}$, subjected to an increase in effective stress of 100 kPa. Solution Overview: Utilize Terzaghi's one-dimensional consolidation theory: $S = \frac{C_v}{H^2} \times T_v \times H$ where (T_v) is the time factor, calculated as: $T_v = \frac{C_v \times t}{H^2}$ Step-by-step Breakdown: - Given Data: $(H = 5, \text{m})$, $(C_v = 1 \times 10^{-7}, \text{m}^2/\text{s})$, $(t = 1, \text{year} = 3.15 \times 10^7, \text{s})$ - Calculate (T_v) : $T_v = \frac{1 \times 10^{-7} \times 3.15 \times 10^7}{(5)^2} = \frac{3.15}{25} = 0.126$ - Find the degree of consolidation: Using standard charts or equations, 50% consolidation typically occurs at $(T_v \approx 0.2)$. Here, $(T_v = 0.126)$, indicating roughly 40-45% consolidation in this time frame. - Estimate settlement: Assuming a total compression of about 10% of the clay layer: $S \approx 0.10 \times 5, \text{m} = 0.5, \text{m}$ In the given timeframe, approximately 40-45% of this settlement (about 0.2 m to 0.225 m) occurs. Key Takeaway: This solution underscores the importance of consolidation theory in predicting settlement and designing for long-term stability.

3. Earth Pressure Theories

Sample Question: Determine the active earth pressure on a retaining wall 4 m high, retaining a backfill with an internal friction angle of 20° and unit weight of 18 kN/m^3 . Solution Overview: Use Rankine's earth pressure theory: $P_a = \frac{1}{2} \gamma H^2 \times K_a$ where $K_a = \frac{1 - \sin \phi}{1 + \sin \phi}$ Step-by-step Breakdown: - Calculate (K_a) : $(\sin 20^\circ \approx 0.342)$ $K_a = \frac{1 - 0.342}{1 + 0.342} \approx \frac{0.658}{1.342} \approx 0.49$ - Calculate (P_a) : $P_a = 0.5 \times 18, \text{kN/m}^3 \times (4, \text{m})^2 \times 0.49$ $P_a = 0.5 \times 18 \times 16 \times 0.49 \approx 0.5 \times 18 \times 7.84 \approx 0.5 \times 141.12 \approx 70.56, \text{kPa}$ Interpretation: The active earth pressure exerted on the wall is approximately 70.56 kPa, guiding structural reinforcement design. Key Takeaway: Earth pressure calculations are central to retaining structure design, and understanding

different theories (Rankine, Coulomb) is essential.
