Understanding Mitosis and Meiosis

What is Mitosis?

Mitosis is a type of cell division responsible for growth, tissue repair, and asexual reproduction in eukaryotic organisms. It results in two genetically identical daughter cells from a single parent cell. The process ensures that each new cell receives an exact copy of the parent cell's DNA, maintaining genetic stability across generations.

Stages of Mitosis

Mitosis is divided into several well-defined stages:

1. **Prophase:** Chromosomes condense, becoming visible under a microscope. The nuclear envelope begins to disintegrate, and the spindle apparatus starts forming.
2. **Metaphase:** Chromosomes align at the cell's equatorial plate, preparing for separation.
3. **Anaphase:** Sister chromatids are pulled apart toward opposite poles of the cell.
4. **Telophase:** Chromatids reach the poles, nuclear envelopes re-form around each set, and chromosomes de-condense.
5. **Cytokinesis:** The cytoplasm divides, resulting in two distinct daughter cells.

What is Meiosis?

Meiosis is a specialized form of cell division that produces gametes—sperm and eggs—in sexually reproducing organisms. Unlike mitosis, meiosis reduces the chromosome number by half, creating haploid cells from diploid parent cells. This reduction is vital for maintaining the stability of the species' genome across generations.

Stages of Meiosis

Meiosis involves two consecutive divisions: meiosis I and meiosis II, each with their own stages:

Meiosis I

1. **Prophase I:** Homologous chromosomes pair up in a process called synapsis, forming tetrads. Crossing over occurs, exchanging genetic material.
2. **Metaphase I:** Tetrads align at the metaphase plate with homologous pairs facing opposite poles.
3. **Anaphase I:** Homologous chromosomes separate and move to opposite poles, but sister chromatids stay together.

4. **Telophase I and Cytokinesis:** Two haploid cells form, each containing sister chromatids.

Meiosis II

1. **Prophase II:** Spindle fibers re-form in each haploid cell.
2. **Metaphase II:** Chromosomes align at the metaphase plate.
3. **Anaphase II:** Sister chromatids are pulled apart toward opposite poles.
4. **Telophase II and Cytokinesis:** Four haploid gametes are produced, each genetically distinct due to crossing over and independent assortment.
