Common Problems and Their Solutions in Barrett O'Neill's Textbook

Below, we review some representative exercises from the textbook and outline their solutions, emphasizing problem-solving techniques relevant for students.

Exercise 1: Computing the Curvature of a Space Curve

Problem: Given a curve in $\mathbb{R}^3$ parameterized by $\mathbf{r}(t) = (\cos t, \sin t, t)$, compute its curvature $\kappa(t)$. Solution Outline: 1. Compute derivatives: $\mathbf{r}'(t) = (-\sin t, \cos t, 1)$ - $\mathbf{r}''(t) = (-\cos t, -\sin t, 0)$ 2. Calculate the magnitude of $\mathbf{r}'(t)$: $|\mathbf{r}'(t)| = \sqrt{\sin^2 t + \cos^2 t + 1} = \sqrt{2}$ 3. Compute the curvature: $\kappa(t) = \frac{|\mathbf{r}'(t) \times \mathbf{r}''(t)|}{|\mathbf{r}'(t)|^3}$ 4. Find the cross product: $\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\sin t & \cos t & 1 \\ -\cos t & -\sin t & 0 \end{vmatrix}$ Calculate determinant to find the vector. 5. Calculate the magnitude of the cross product and substitute into the curvature formula. Key Takeaway: The solution involves standard vector calculus techniques—derivatives, cross products, and magnitudes—to find curvature.

Exercise 2: Proving that the Geodesic on a Sphere is a Great Circle

Problem: Show that the shortest path between two points on a sphere lies along a great circle. Solution Outline: 1. Recall the definition of a geodesic as a curve that locally minimizes length. 2. Express the problem using the calculus of variations: minimize the length functional among curves on the sphere. 3. Set up the variational problem: - Parameterize the sphere (S^2) by spherical coordinates. - Write the length integral. 4. Derive the Euler-Lagrange equations for the problem. 5. Solve the differential equations: - Show that the solutions correspond to great circles (circles with centers at the sphere's center). 6. Conclusion: - Geodesics are exactly great circles, confirming the classical result. Key Takeaway: The proof involves calculus of variations and differential equations, illustrating the deep connection between geometry and analysis.

Exercise 3: Computing Gaussian Curvature of a Surface

Problem: Find the Gaussian curvature (K) of a torus parameterized by: $\mathbf{X}(u, v) = ((R + r \cos v) \cos u, (R + r \cos v) \sin u, r \sin v)$ where $(R > r > 0)$. Solution Outline: 1. Compute the first fundamental form: - Find $(\mathbf{X}_u, \mathbf{X}_v)$. - Calculate $(E = \langle \mathbf{X}_u, \mathbf{X}_u \rangle, F = \langle \mathbf{X}_u, \mathbf{X}_v \rangle, G = \langle \mathbf{X}_v, \mathbf{X}_v \rangle)$. 2. Compute the second fundamental form: - Determine the unit normal vector $(\mathbf{N})$. - Calculate $(\mathbf{X}_{uu}, \mathbf{X}_{uv}, \mathbf{X}_{vv})$. - Find (L, M, N) . 3. Apply Gauss's Theorema Egregium: $K = \frac{LN - M^2}{EG - F^2}$ 4. Simplify the expression to find (K) at any point $((u, v))$. Key Takeaway: The solution involves differential geometry techniques—fundamental forms and curvature formulas—highlighting how parametric representations facilitate curvature calculations.
