### Understanding the Distributive Property in Algebra

Before diving into worksheets and practice problems, it's essential to understand what the distributive property entails and why it's a crucial component in solving equations.

#### What Is the Distributive Property?

The distributive property is a fundamental algebraic rule that states:

$$a(b + c) = ab + ac$$

This property allows you to distribute a single term across terms inside parentheses, simplifying and solving equations efficiently.

#### Why Is the Distributive Property Important?

In algebra, many equations require expanding expressions to isolate variables. The distributive property is often the first step in simplifying complex expressions, especially when variables are multiplied by sums or differences.

#### Why Use a Solving Equations with Distributive Property Worksheet?

Worksheets focused on the distributive property provide several benefits:

1. **Structured Practice:** They offer a step-by-step approach to solving equations involving distribution.
2. **Identify Common Mistakes:** Repetitive exercises help students recognize and avoid errors.
3. **Build Confidence:** Guided problems reinforce understanding and improve problem-solving speed.
4. **Prepare for Assessments:** Regular practice ensures readiness for tests and real-world applications.

### Key Steps to Solving Equations Using the Distributive Property

A systematic approach simplifies the process and leads to correct solutions. Here are the essential steps:

#### 1. Recognize When to Use the Distributive Property

Look for expressions with a single term outside parentheses multiplied by terms inside parentheses, such as:

1.  $a(b + c)$
2.  $3(x - 5)$

#### 1. Apply the Distributive Property to Expand the Expression

Distribute the outside term to each term inside the parentheses:

1. For  $a(b + c)$ , write:  $ab + ac$
2. For  $3(x - 5)$ , write:  $3x - 15$

## 1. Combine Like Terms

After expansion, simplify the expression by combining similar terms:

1.  $2x + 3x$  becomes  $5x$
2.  $4y - 2y$  becomes  $2y$

## 1. Isolate the Variable

Use inverse operations to get the variable alone on one side:

1. Add or subtract constants from both sides
2. Divide or multiply coefficients as needed

## 1. Solve for the Variable

Finally, perform the necessary operations to find the value of the variable.

## Sample Problems and Walkthroughs

Let's explore some example problems to illustrate the process.

### Example 1: Basic Distributive Property Application

Solve for x:

$$2(3x + 4) = 16$$

Step 1: Expand using the distributive property:

$$2 \cdot 3x + 2 \cdot 4 = 16$$

$$6x + 8 = 16$$

Step 2: Subtract 8 from both sides:

$$6x = 8$$

Step 3: Divide both sides by 6:

$$x = 8 / 6 = 4 / 3$$

### Example 2: Combining Distribution and Like Terms

Solve for y:

$$3(y - 2) + 4 = 2y + 1$$

Step 1: Expand the distribution:

$$3y - 6 + 4 = 2y + 1$$

Step 2: Simplify the left side:

$$3y - 2 = 2y + 1$$

Step 3: Subtract  $2y$  from both sides:

$$3y - 2y - 2 = 1$$

Simplifies to:

$$y - 2 = 1$$

Step 4: Add 2 to both sides:

$$y = 3$$
