Introduction to Neural Networks and AI

Artificial Intelligence refers to the simulation of human intelligence processes by machines, particularly computer systems. Neural networks, inspired by the human brain's architecture, are a foundational technology underpinning many AI systems today. They enable machines to recognize patterns, learn from data, and make decisions with impressive accuracy.

What is AI?

AI encompasses a broad range of techniques designed to perform tasks that typically require human intelligence, such as:

1. Image and speech recognition
2. Language translation
3. Decision making
4. Autonomous driving

What are Neural Networks?

Neural networks are computational models composed of interconnected layers of nodes (neurons) that process data by passing signals and adjusting their connections. They are particularly powerful for handling complex, unstructured data like images, audio, and text.

Fundamentals of Neural Networks

Understanding neural networks begins with grasping their basic structure and functioning.

Basic Components of Neural Networks

A typical neural network includes:

1. **Input Layer:** Receives raw data (e.g., pixel values of an image).
2. **Hidden Layers:** Intermediate layers where data is processed and features are extracted.
3. **Output Layer:** Produces the final prediction or classification.

How Do Neural Networks Work?

The process involves:

1. Feeding data into the input layer.
2. Propagating signals through the hidden layers, where each neuron computes a weighted sum of its inputs, applies an activation function, and passes the result forward.
3. Generating an output that predicts or classifies the input data.
4. Adjusting the internal weights based on the error between the predicted and actual output (learning). This process is called training.

Activation Functions

Activation functions introduce non-linearity, enabling neural networks to learn complex patterns. Common functions include:

1. Sigmoid
2. ReLU (Rectified Linear Unit)
3. Leaky ReLU
4. Tanh

Training Neural Networks

Training is the process of teaching the neural network to make accurate predictions by adjusting its weights based on data.

Key Concepts in Training

1. **Loss Function:** Measures the difference between the network's predictions and the actual targets.
2. **Optimization Algorithm:** Adjusts weights to minimize the loss function. Gradient descent is the most common method.
3. **Epochs:** Complete passes through the training dataset.
4. **Batch Size:** Number of samples processed before updating the weights.

Backpropagation

Backpropagation is the algorithm used to compute gradients of the loss function with respect to each weight, enabling efficient learning. It involves:

1. Calculating the error at the output layer.
2. Propagating this error backward through the network.
3. Updating weights using gradient descent to reduce the error.

Types of Neural Networks

Different neural network architectures are suited to various tasks.
