Fundamentals of Frog Muscular Structure

General Characteristics

The musculature of frogs is predominantly composed of voluntary, striated muscle tissue organized into various groups and layers. These muscles are categorized based on their location and function: - Superficial muscles: involved in movement of limbs and skin - Deep muscles: responsible for internal movements, postural support, and fine control A typical frog muscle diagram displays these muscles with labels, highlighting their relative positions and attachments.

Muscle Layers and Arrangement

In a standard frog muscle diagram, the muscles are often depicted in layers: - Superficial fascia and skin muscles: such as the cutaneous muscles - Extrinsic limb muscles: e.g., biceps, triceps, gastrocnemius - Intrinsic limb muscles: small muscles close to bones and joints - Axial muscles: dorsal and ventral muscles supporting the vertebral column

Major Muscle Groups in the Frog

Understanding the primary muscle groups is essential to grasp how frogs execute their movements.

Muscles of the Head and Neck

- Cervical muscles: facilitate head movements - Masticatory muscles: involved in jaw movement Diagrammatic features include: - The sternohyoid muscle - The mylohyoid muscle - The temporalis muscle (though less prominent in frogs)

Muscles of the Trunk and Back

- Epaxial muscles: dorsal muscles that support the vertebral column - Hypaxial muscles: ventral muscles involved in breathing and posture Key muscles include: - Longissimus and iliocostalis muscles - Rectus abdominis and obliques In diagrams, these are typically shown as

layered muscles, radiating from the vertebral column.

Muscles of the Limbs
